

Movie Recommendation System

TEAM 2: Zongyao Li, 002191556 Xuliang Mei, 001305818 Jiaqi Wang 001023711

PROJECT GOAL

This system is designed to:

- Let users get the content they need faster and better
- Let content be pushed faster and better to users who like it
- Let the website (platform) more effectively retain user resources

Use Case

Recommend movies for users based on:

- All-time popular movies
- Recent popular movies
- Popular movies in different genres

Build personalized movie recommendation list based on user activities:

- Analyze user real time ratings of movies and build recommendation
- Analyze activity history and build recommendation

Show similar movies based on movie properties:

- Name
- Genres

Scala Version

Used 2.11.* to be compatible with other packages

Problem with the latest 2.13.*/3.* version:

- Package consistency issue
- Tool incompatibility
- Dependency confliction
- System environment stability

Project Organization

Used Maven to organized the project for:

- Module management
- Package dependencies
- Program structure
- Easier workload division

Modules

Movie Recommendation

|_ Recommender

|_ Data Loader

Load data to database for future use

|_ Content Recommender

Recommend movies based on genre

|_ Statistics Recommender

Recommend movies based on popularity

|_ Offline Recommender

Recommend movies based on historical activities

|_ Streaming Recommender

Recommend movies based on real time rating activities

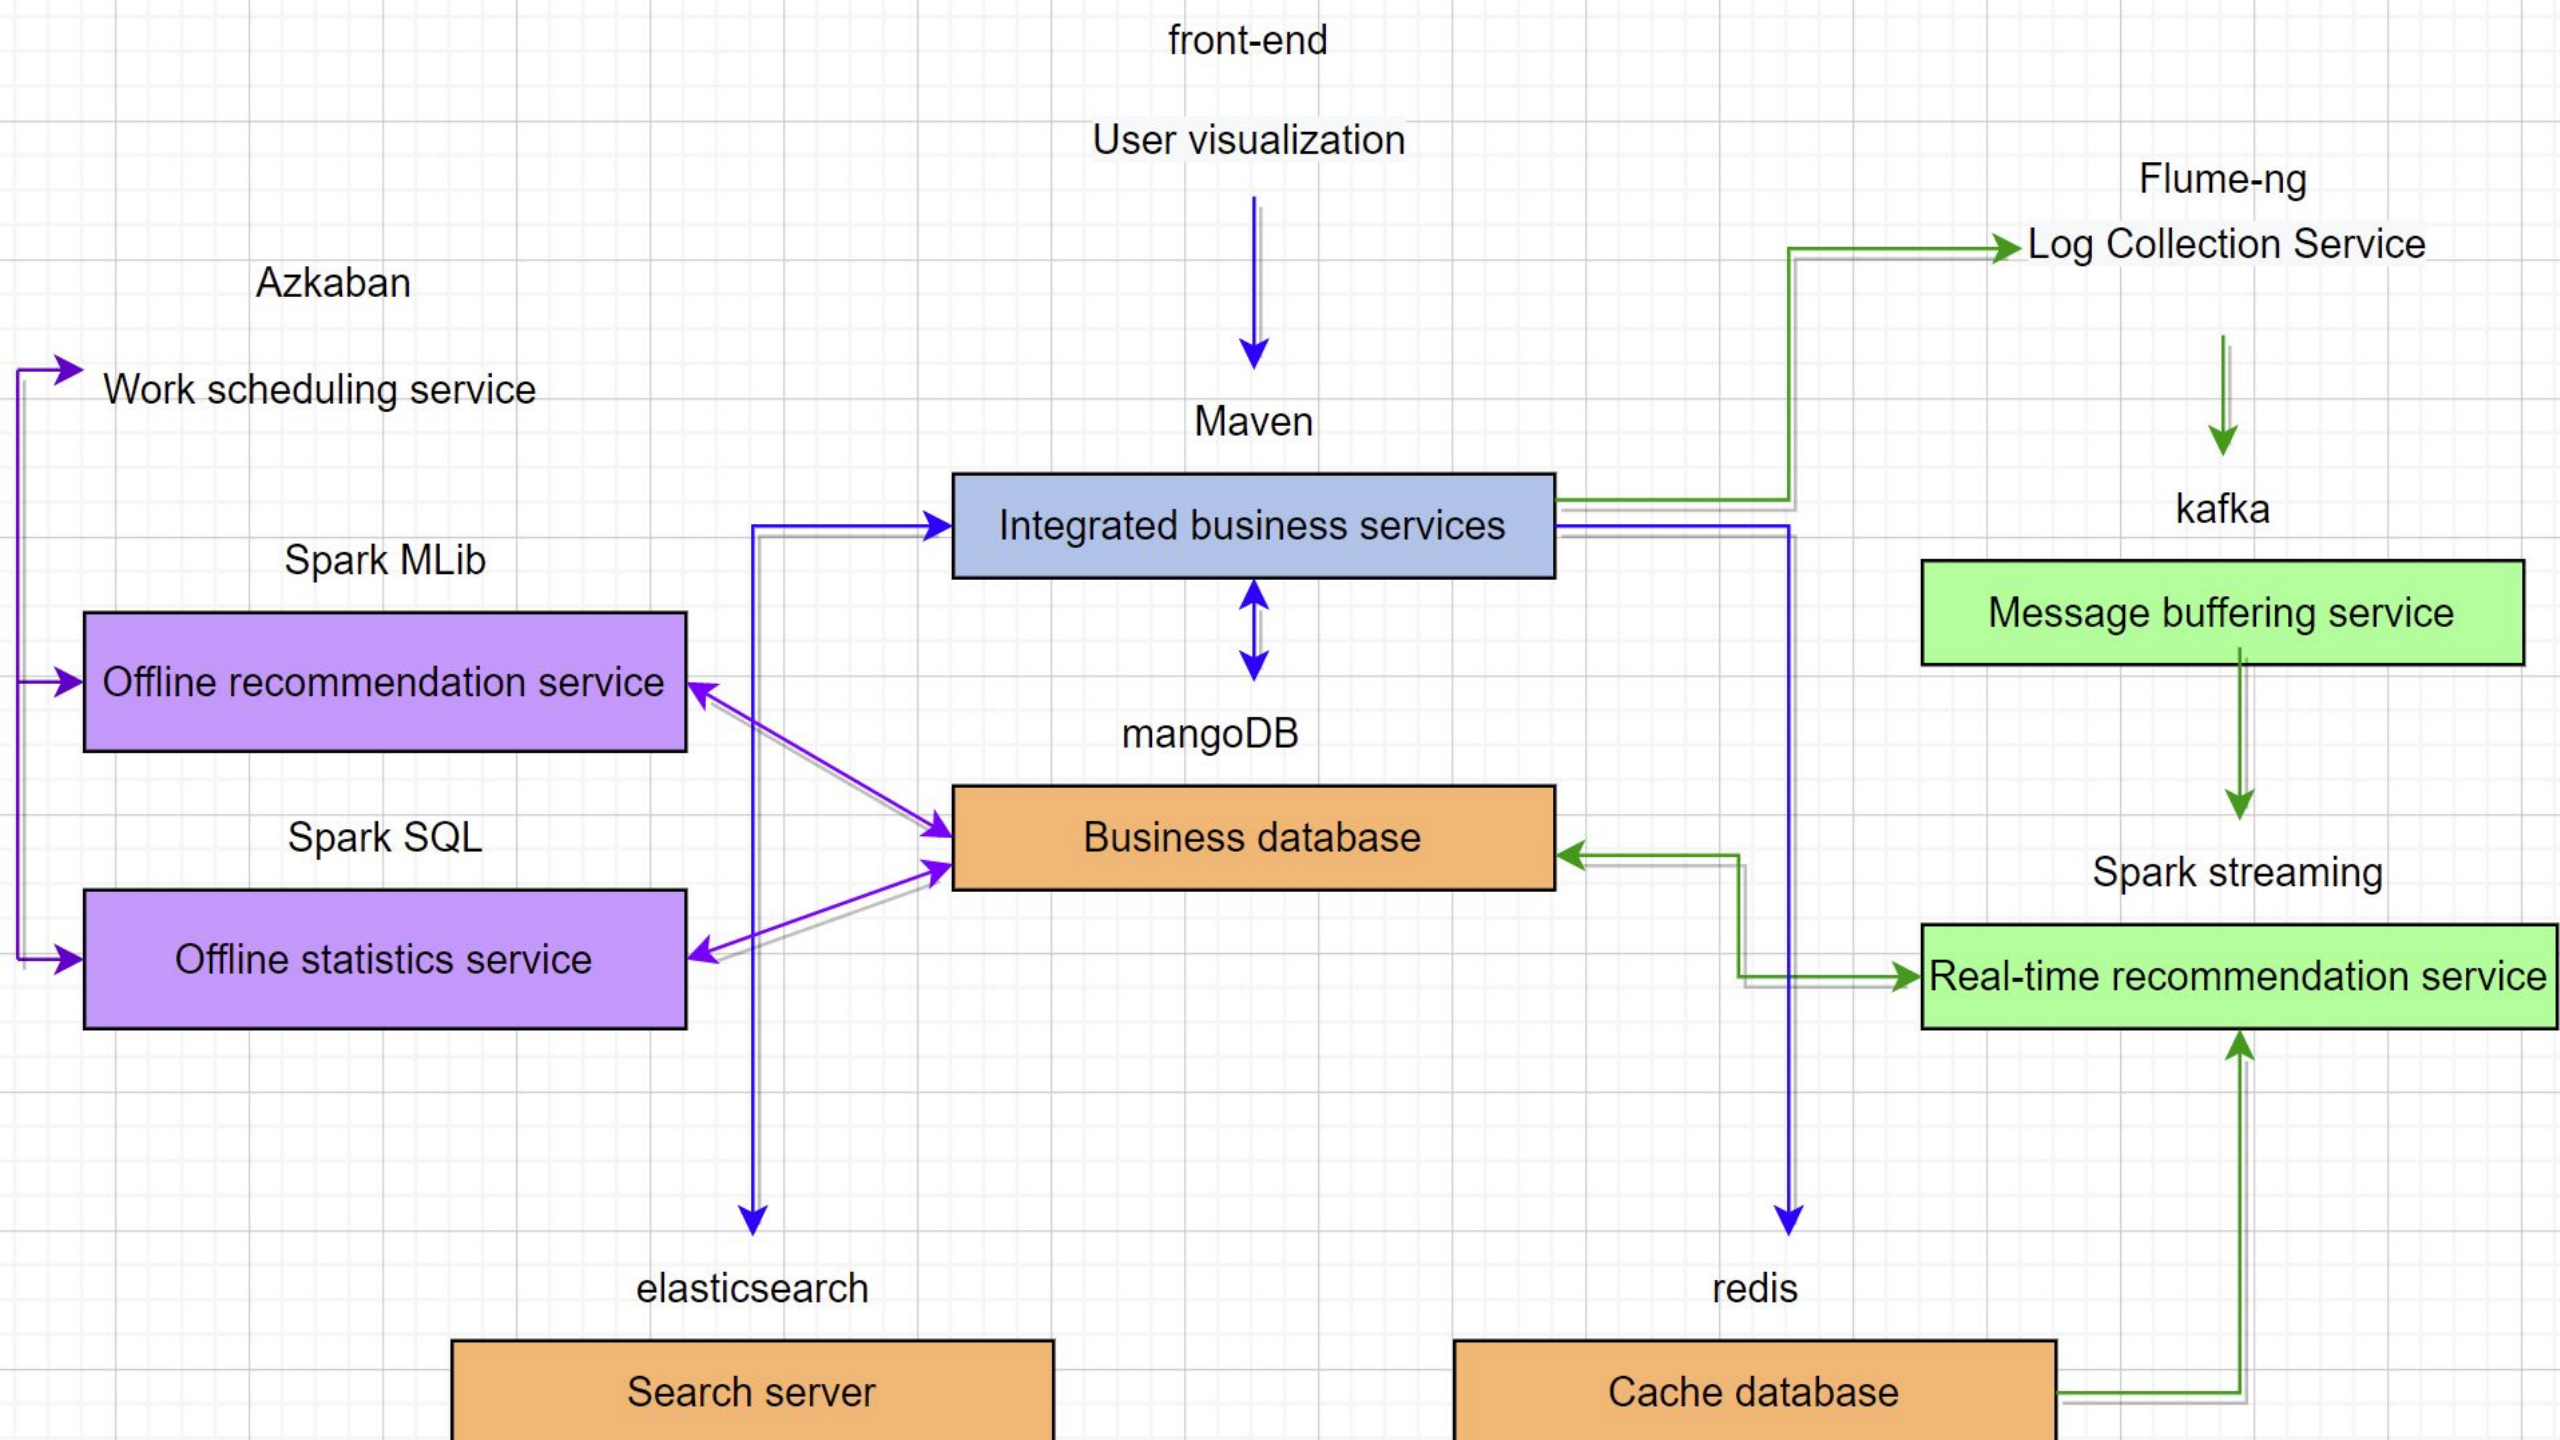

|_ Kafka Log Manager

Logger and processor

|_ User Interface

|_ Web Page

Not yet implemented properly

Data sources

The data source is [Kaggle's MovieLens 20M Dataset](#)

The magnitude

genome_scores.csv:
11.7m

genome_tags.csv:
1128

link.csv: 27.3k

movie.csv: 27.3k

rating.csv: 20.0m

tag.csv: 466k

Dataframe or Dataset?

Used dataframe for:

- The main container of data during operation
- Reading data from files
- Reading data from database
- Writing new datas into database.

Used dataset for:

- Column selection (filter out unwanted columns)

Demo (content based recommendation)

The screenshot shows the MongoDB Compass interface for the `localhost:27017/recommender.ContentMovieRecs` database. The left sidebar lists the database structure, including collections like `admin`, `local`, `recommender`, `AverageMovies`, `ContentMovieRecs`, `GenresTopMovies`, `Movie`, `MovieRecs`, `RateMoreMovies`, `RateMoreRecentlyMovies`, `Rating`, `Tag`, and `UserRecs`. The main panel displays the `ContentMovieRecs` collection with a query filter of `{ "filter" : "example" }`. The query returned 2791 documents, and the first 20 are displayed. The document details show a `_id` of `ObjectId('61b0274360f035932407eedb')` and a `mid` of `1084`. The `recs` array contains 17 objects, each with a `mid` and a `score`.

Summary & Reflection

Achievements

1. Achieved the overall goal—attain various level of recommendation
2. Got familiar with common big data technologies and tools
3. Strengthened the programming ability of scala

Known Shortage

1. Lack of proper deployment of the front-end

Thanks!
Any questions?
